

NOTIFICAÇÃO DE PROPOSTA DE REGRA DIRETRIZ DE AERONAVEGABILIDADE	REPÚBLICA FEDERATIVA DO BRASIL AGÊNCIA NACIONAL DE AVIAÇÃO CIVIL – ANAC Gerência Técnica de Aeronavegabilidade Continuada
Referência: NPR/DA 2023-737-01	Data: 27 dez. 2023
<p>De acordo com as provisões do RBAC 11, a Gerência Técnica de Aeronavegabilidade Continuada (GTAC) está propondo a emissão de uma Diretriz de Aeronavegabilidade aplicável ao produto aeronáutico abaixo referido.</p> <p>Todas as pessoas interessadas poderão enviar seus comentários até a data indicada no item 2, fazendo menção à Referência acima citada, para o seguinte endereço:</p> <p>Agência Nacional de Aviação Civil (ANAC) - Gerência Técnica de Aeronavegabilidade Continuada (GTAC) Rua Doutor Orlando Feirabend Filho, nº 230 Centro Empresarial Aquárius - Torre B - 14º ao 18º andares Parque Residencial Aquárius 12246-190 – São José dos Campos – SP - Tel.: (12) 3203-6600 - E-mail: pac@anac.gov.br</p>	
<p>1. Proponente: Gerência Técnica de Aeronavegabilidade Continuada.</p> <p>2. Comentários: Deverão ser recebidos até o dia 31 mar. 2024.</p>	

APLICABILIDADE:

- (a) Esta Diretriz de Aeronavegabilidade (DA) aplica-se aos aviões BOEING modelo 737-8, todos os números de série.

CANCELAMENTO / REVISÃO:

Não aplicável.

MOTIVO:

Esta DA foi motivada pela constatação do potencial de interferência em rádio altímetros, advinda do Serviço Móvel Pessoal 5G na Banda C, atualmente operando na Subfaixa de Radiofrequências de 3.300 MHz a 3.700 MHz. Durante pousos e decolagens, como resultado dessa interferência, determinados sistemas do avião podem não funcionar adequadamente, resultando em uma maior distância de pouso ou decolagens abortadas, devido ao efeito da interferência na abertura dos reversores de empuxo, acionamento do speedbrake, acionamento de spoilers e tração de IDLE, independentemente do tipo de aproximação e condições ambientais. O desempenho degradado de desaceleração pode levar a uma saída de pista.

Como esta condição pode ocorrer em vários produtos e afeta a segurança de voo, é requerida a adoção de uma ação corretiva e, portanto, fica configurada a causa justa para impor o cumprimento destes requisitos no prazo estabelecido.

AÇÃO REQUERIDA:

Revisão do Manual de Voo do Avião (*Airplane Flight Manual - AFM*).

CUMPRIMENTO:

O cumprimento deve ser efetuado conforme abaixo, a menos que já tenha sido executado anteriormente.

(b) Revisão do Manual de Voo do Avião (*Airplane Flight Manual*)

- (1) Para os aviões identificados no parágrafo (a) desta DA que não atendem o critério de um “avião com rádio altímetro tolerante”, conforme estabelecido na PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023, dentro de 10 dias após a data de efetividade desta DA, revise a Seção de Limitações para incluir a informação a seguir:

Radio Altimeter 5G C-Band Interference, Takeoff and Landing Performance

Due to the presence of 5G C-Band wireless broadband interference, the following limitations are required to dispatch or release to airports, and takeoff and landing on runways, in the Brazilian airspace.

Minimum Equipment List (MEL)

Dispatch or release with any of the following MEL items is prohibited:

- 32-42-01 – Antiskid Systems
- 32-42-02 – Alternate Antiskid Valves
- 32-42-03 – Automatic Brake Systems
- 32-44-01 – Parking Brake Valve

Landing Operations on Runways with ice, wet ice, water on top of compacted snow, dry snow, or wet snow over ice

Dispatch or release to, or takeoff or landing on, runways with ice, wet ice, water on top of compacted snow, dry snow, or wet snow over ice is prohibited.

Takeoff and Landing Performance

Operators must use the **5G C-Band Interference Takeoff Performance and Landing Distance Calculation** procedure contained in the Operating Procedures Section of this AFM.

- (2) Para os aviões identificados no parágrafo (a) desta DA, que não atendem o critério de um “avião com rádio altímetro tolerante”, conforme estabelecido na PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023, dentro de 10 dias após a data de efetividade desta DA, revise a Seção de Procedimentos Operacionais (*AFM Operating Procedures Section*) para incluir as informações a seguir:

5G C-Band Interference Takeoff Performance and Landing Distance Calculation

Dispatch Guidance – Takeoff Performance

Stopping distance during a rejected takeoff (RTO) can be significantly increased due to the following potential effects on airplane systems:

- Limited spoiler extension
- Higher engine idle
- Thrust reverses may not deploy

For the increased stopping distance during an RTO, refer to the Departure Airport, Takeoff Performance section below.

Dispatch Guidance – Destination or Alternate Airport – Landing Performance

Calculate the required landing distance (select Method A or Method B)

Method A: Use of normal landing performance increased by a predetermined percentage

Use Prior to Descent, Required Landing Distance section below

End of Method A

Method B: Use of the Non-normal configuration landing distance table for SPOILERS

Use the SPOILERS Non-Normal Configuration Landing Distance table in the Performance chapter of the AFM, or the applicable table below, for flaps 30 or flaps 40

- Use the distance for MAX MANUAL braking configuration with the appropriate runway condition at the estimated time of arrival.
- Apply all of the appropriate distance adjustments to include the reverse thrust adjustment for NO REVERSE (NO REV)

For non-contaminated runway condition, increase the resulting unfactored distance by 15% to obtain the required landing distance.

For contaminated runway condition, increase the resulting unfactored distance by 30% to obtain the required landing distance.

*A runway is contaminated when more than 25 per cent of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by: — water more than 3 mm (0.125 in) deep; or — compacted snow or ice, including wet ice.

End of Method B

Departure Airport, Takeoff Performance

Select Method 1 or 2 to adjust the accelerate stop distance available (ASDA)

Note: Both methods provide an acceptable margin of safety.

Method 1: Adjust the ASDA by a predetermined value.

Adjust the ASDA by using the following adjustment:

Runway condition	Subtract from ASDA
Dry	950 feet
Wet (non-contaminated)	3,700 feet
Contaminated	4,900 feet

*A runway is contaminated when more than 25 per cent of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by: — water more than 3 mm (0.125 in) deep; or — compacted snow or ice, including wet ice.

Use the adjusted ASDA and complete the takeoff performance calculations using actual departure runway conditions and actual departure environmental conditions. Do not take credit for use of reverse thrust when calculating takeoff performance.:

End of Method 1

Method 2: Adjust the ASDA by a predetermined factor.

Multiply the ASDA by the following factor:

Runway condition	ASDA Factor
------------------	-------------

Dry	0,86
Wet (non-contaminated)	0,71
Contaminated	0,65

*A runway is contaminated when more than 25 per cent of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by: — water more than 3 mm (0.125 in) deep; or — compacted snow or ice, including wet ice.

Use the adjusted ASDA and complete the takeoff performance calculations using actual departure runway conditions and actual departure environmental conditions. Do not take credit for use of reverse thrust when calculating takeoff performance.

End of Method 2

Prior to takeoff:

Verify normal radio altimeter indications.

Climb out:

- TO/GA mode may not be available
- Monitor pitch mode engagement
- Monitor roll mode engagement
- Autopilot may not engage

Prior to Descent, Required Landing Distance

Do a time of arrival (en route) landing distance assessment using Method A or B. Use the SPOILERS non-normal configuration landing distance table in the Performance chapter of the AFM, or the applicable table below, for flaps 30 or flaps 40.

Method A: Use of normal landing performance and increase by a predetermined percentage.

Use the Normal configuration Landing Distance table for flaps 30 or flaps 40.

Note: The distances and adjustments shown in the Normal configuration Landing Distance tables are factored and have been increased 15%

Select the appropriate runway conditions.

Select the distance for the MAX MANUAL braking configuration.

Apply all of the appropriate distance adjustments.

Note: Do not apply adjustments for reverse thrust

To obtain the required landing distance, increase the resulting factored distance by the percentage below in Table 1 based on the runway condition code or runway braking action.

Table 1:

Runway condition Code	Percentage
-----------------------	------------

Dry	23%	
Wet (non-contaminated)	65%	
Contaminated	113%	

*A runway is contaminated when more than 25 per cent of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by: — water more than 3 mm (0.125 in) deep; or — compacted snow or ice, including wet ice.

Determine autobrake stings using the **Determine Autobrake Settings** section below

End of Method A

Method B: Use of the Non-Normal Configuration Landing Distance table for SPOILERS

Use the SPOILERS Non-Normal Configuration Landing Distance table in the Performance chapter of the AFM, or the applicable table below, for flaps 30 and flaps 40.

Select the appropriate runway condition.

Select the distance for MAX MANUAL braking configuration.

Apply all of the appropriate distance adjustments including the reverse thrust adjustment for no reverse (NO REV)

For non-contaminated runway condition, increase the resulting unfactored distance by 15% to obtain the required landing distance.

For contaminated runway condition, increase the resulting unfactored distance by 30% to obtain the required landing distance

Determine autobrake settings using the Determine Autobrake Settings section below.

SPOILERS Non-NORMAL Configuration Landing Distance Tables

737-8 One Position Tailskid, FLAPS 30, VREF30									
Landing Distance and Adjustments (feet)									
	Reference Distance	Weight adjustment	Altitude adjustment **	Wind adjustment per 10 knots	Slope Adjustment per 1%	Temperature Adjustment per 10° C	Approach Speed Adjustment	Reverse Thrust Adjustment	
Runway condition	150,000 LB Landing Weight	Per 10,000 LB Above/Below 150,000 LB	Per 1,000 ft STD/HIGH	Head/Tail wind	Down/Up Hill	Above/Below ISA	Per 5 KTS above VREF	One Reverser	No reverser
Dry	4870	250/-270	130/170	-210/680	80/-70	130/-130	310	180	280
Wet (non-contaminated)	7330	450/-450	250/340	-360/1270	310/-250	220/-220	420	910	2090
Wet (contaminated)	8290	610/-570	330/460	-470/1660	440/-340	280/-280	450	1530	4410

737-8 Two Position Tailskid, FLAPS 30, VREF30									
Landing Distance and Adjustments (feet)									
	Reference Distance	Weight adjustment	Altitude adjustment **	Wind adjustment per 10 knots	Slope Adjustment per 1%	Temperature Adjustment per 10° C	Approach Speed Adjustment	Reverse Thrust Adjustment	
Runway condition	150,000 LB Landing Weight	Per 10,000 LB Above/Below 150,000 LB	Per 1,000 ft STD/HIGH	Head/Tail wind	Down/Up Hill	Above/Below ISA	Per 5 KTS above VREF	One Reverser	No reverser
Dry	4670	250/-250	130/170	-210/680	80/-70	120/-120	300	160	280

Wet (non-contaminated)	6870	520/-410	250/340	-350/1220	310/-240	200/-200	410	800	1820
Wet (contaminated)	7630	680/-520	330/450	-450/1610	410/-320	260/-260	450	1250	3400

*A runway is contaminated when more than 25 per cent of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by: — water more than 3 mm (0.125 in) deep; or — compacted snow or ice, including wet ice.

**For landing distance at or below 8,000 ft, apply the STD adjustment. For altitudes higher than 8,000 ft, first apply the STD adjustment to derive a new reference landing distance for 8,000 ft then apply the HIGH adjustment to this new reference distance.

Reference distance is based on MAX MANUAL braking, sea level, standard day, no wind or slope and maximum reverse thrust.

Reference distance includes a distance from the threshold to touchdown associated with a flare time of 7 seconds.

Distances are based on SPOILERS failure distances which conservatively approximate the effects of 5G interference after the Reverse Thrust Adjustment for no Reversers is applied.

Actual (unfactored) distances are shown.

Note: per procedure, MAX MANUAL braking is not required for normal operations

End of Method B

Determine Autobrake Settings

- Determine desired AUTOBRAKE settings by using the normal configuration landing distance.

Note: Normal manual or normal autobrakes can be used. The use of maximum brakes is not needed except as stated in the During Landing section below

During Approach

- Monitor radio altimeters for anomalies.
- Monitor performance of autopilot and autothrottle. If the autopilot or autothrottle is not performing as expected, disconnect both the autopilot and autothrottle and apply normal inputs to ensure proper control of the flight path.

At DA(H), MDA(H), or the Missed Approach Point

- If suitable visual reference is established, disengage the autopilot and autothrottle and continue for a normal manual landing.
- If a go-around is needed, do the go-around and the missed approach procedure either in manual or automatic flight.

During Landing

- Radio altitude-based altitude aural callouts during approach may not be available or may be erroneous.
- Manual deployment of the speedbrakes may be needed.
- If the thrust reversers do not deploy, immediately ensure the speedbrakes are extended, apply manual braking, and modulate as needed for the existing runway conditions.

Note: In some conditions, maximum manual braking may be needed throughout the entire landing roll.

During Go-around and Missed Approach

- TO/GA mode may not be available.
- Monitor thrust and verify that thrust increases.
- Monitor pitch mode engagement.
- Monitor roll mode engagement.
- Autopilot may not engage

NOTA 1: As modificações no AFM requeridas por esta DA podem ser cumpridas inserindo-se uma cópia desta DA no AFM do avião.

NOTA 2: para o propósito desta DA, um “avião com rádio altímetro tolerante” é aquele cuja combinação avião-radio altímetro foi aceita pela ANAC e demonstra tolerância aos limites definidos na PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023.

(3) Para os aviões identificados no parágrafo (a) desta DA, definidos como “aviões com rádio altímetro tolerante”, conforme estabelecido da PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023, nenhuma ação é requerida.

(c) Ação Terminal para a Limitação do AFM

A modificação do avião de um “avião com rádio altímetro não tolerante” para um “avião com rádio altímetro tolerante” conforme a PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023, encerra as limitações dos parágrafos (b)(1) e (b)(2) desta DA. Após a modificação para um “avião com rádio altímetro tolerante”, conforme a PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023, remova as alterações especificadas nos parágrafos (b)(1) e (b)(2) desta DA.

(d) Atendimento à PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023.

Para o cumprimento com esta DA, a aceitação de uma combinação avião-rádio altímetro como “avião com rádio altímetro tolerante” depende dos dados fornecidos para demonstrar tolerância aos níveis estabelecidos na PORTARIA Nº 13.365/SAR, de 14 de dezembro de 2023. Esses dados devem ser submetidos à ANAC através do endereço 5g@anac.gov.br.

(e) Método alternativo de cumprimento.

Um método ou um tempo de cumprimento diferente para os requisitos desta DA pode ser usado se aprovado pelo Gerente da Gerência Técnica de Aeronavegabilidade Continuada (GTAC) da ANAC.

(f) Informações adicionais.

Para dúvidas ou informações adicionais, contatar pac@anac.gov.br
